

Monash Radiator Traps and Repair Parts

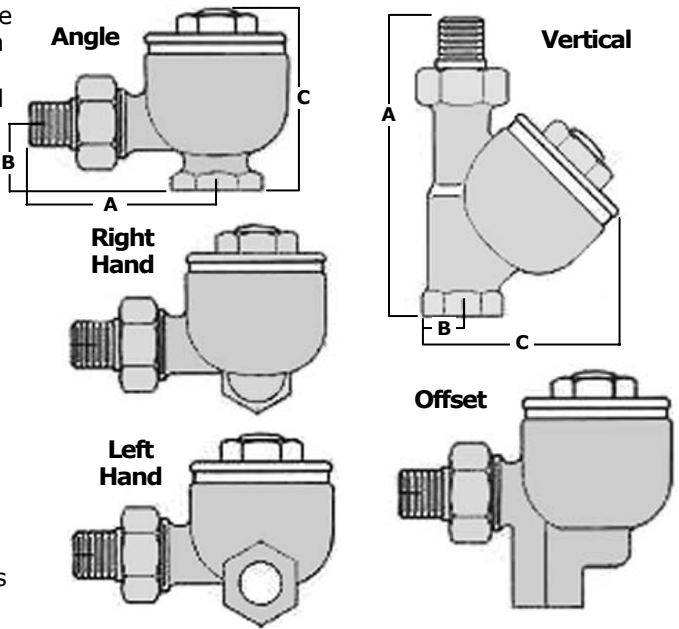

Monash radiator traps provide reliable condensate drainage from the steam heating equipment. Once the steam within the radiator gives-up heat and turns back into water, the Monash thermostat assembly quickly opens, thereby allowing the condensate to return back to the boiler where it once again becomes steam.

■ The bellows does not expand when simple pressure is created assuring positive action with the combination of temperature and pressure within the system.

■ **"Fail-Safe"** design -- In the event the bellows ruptures, it expands to the closed position. The result is a "cold heater" signal for maintenance.

■ The Monash steam trap's bellows is constructed of stainless steel.
