A new generation of very efficient boilers utilizing ALUMINUM HEAT EXCHANGERS are becoming more popular in today’s marketplace. These new boilers typically heat three times faster than traditional boilers and require a specific, unique blend of anti-freeze specific to protecting against acid corrosion.

Cryo-tek -100/AL is a blend of virgin (not recycled) propylene glycol and Hercules exclusive Triple Protection additives designed for use in hydronic heating and cooling closed loop piping systems (including PEX and radiant tube heating systems), ice melt and general heating systems where aluminum heat exchangers are installed.

Hercules Triple Protection additives provide outstanding protection against acid corrosion, scale and sedimentation formation in properly maintained systems containing recommended concentrations of cryo-tek Anti-Freeze.

- Acid neutralizing agent protects by neutralizing corrosive acids.
- Mineral Deposition Preventative eliminates scale formation on critical heat transfer surfaces, piping systems and equipment.
- Mineral Sediment Preventative keeps minerals in solution, resisting formation of clusters of mineral salts and preventing particles from precipitating out of solution.

Used at recommended levels, all three agents work together to prevent bio film (slime) build-up. Cryo-tek -100/AL may be used in systems fabricated with metal, plastics (except CPVC) and rubber piping, fittings, seals, and other parts. Corrosion inhibitors in all cryo-tek products protect against corrosive build-up within the piping loop and are effective with most metals including steel, aluminum* and copper. Cryo-tek solutions have a high specific heat and are efficient at transferring heat.

As packaged, cryo-tek is non-flammable, odorless, non-irritating, and compatible with Hercules boiler stop leaks.

Formulated for the maximum propylene glycol protection directly out of the container. Certified Performance: Freeze Protection Down to -60°F / -51°C. Pumpable down** to -70°F / -57°C, and Burst Protection Down to -100°F / -73°C. Cryo-tek -100/AL can be diluted with water for less severe conditions. (See Chart page 3.)

Test Kits and Accessories
Freeze protection levels and corrosion protection levels should be checked annually. Use Hercules Refractometer (35290) and pH test Meter (35272) or, cryo-tek Test Kit (35271). Add additional cryo-tek product if freeze protection is inadequate. Add cryo-tek -100/AL Inhibitor (35274) if pH is below 7.0. (see Maintenance, page section)

* Please check with equipment manufacturer of system to determine compatibility with this product.
**Minimum flow protection levels are estimated and are dependent on system and equipment.

APPROVALS AND LISTINGS
The virgin propylene glycol used in cryo-tek -100/AL and all cryo-tek products is "GRAS" (Generally Recognized As Safe) for incidental contact with food.

SPECIFIC USES
Use any cryo-tek Anti-Freeze in hydronic closed loop heating and cooling systems, chillers, ice melt, solar heating systems, and general plumbing systems that require freeze protection. Cryo-tek -100/AL is specifically formulated for aluminum based heat exchangers.

SPECIFIC APPLICATIONS*
Add cryo-tek product to protect pipes from freezing and bursting. Although cryo-tek -100/AL is specifically designed for use in boilers with aluminum heat exchangers, it can be used in more traditional applications, such as chiller systems, recreational vehicles, seasonal homes, mobile homes, trailers, boats, sprinkler systems, and industrial use.

WARNINGS OR CAUTIONS
- Read all cautions and directions carefully before using this product.
- Not for use in steam systems.
- Not for use with CPVC pipe and fittings.
- Use Hercules boiler liquid or base hit™ II to stop leaks on system containing cryo-tek products.
- Do not use in internal combustion engines as a coolant.
- Do not use in water softeners. Disconnect all water softeners from system or provide back flow protection to prevent contamination of brine or resin bed.
- Cryo-tek Products are not recommended:
  1. For use in systems containing galvanized components.
  2. For open solar systems and systems where operating stagnation temperatures are regularly over 300°F / 150°C.
  3. For systems with concentrating solar collectors or evacuated tube solar collectors.
(Please check with equipment manufacturer of system to determine compatibility with this product).

CAUTION REGARDING COMPETITIVE PRODUCTS:
Hercules cryo-tek products are formulated using virgin propylene glycol and high purity Triple Protection Additives for assurance of materials compatibility and non-toxicity characteristics. Dilution or mixing of cryo-tek products with other manufacturers’ products may compromise these critical requirements and is not recommended.

DIRECTIONS FOR USE

1. CLEAN THE SYSTEM - It is recommended that any system, whether new or existing, be thoroughly cleaned prior to being charged with cryo-tek -100/AL. Any system contaminated with dirt and other materials reduces efficiency and wears the system prematurely. New systems need to be free of flux, solder residue, grease and any foreign particles. Existing systems need to be flushed and cleaned to eliminate any build-up of rust, scale, lime and other non-organic matter. All systems should be checked for leaks prior to installation of any cryo-tek product. Minor leaks can be sealed with Hercules base hit II or Hercules boiler liquid.

* For special applications which may not be covered on this or other Hercules literature, please contact Hercules Technical Services Department by phone at 1-800-221-9330 or send a fax to 1-800-333-3496.
2. MEASURE THE TOTAL CAPACITY OF THE SYSTEM using one of the following methods:

**DIRECT METHOD**
A. Fill system completely, making sure all components of system are full.
B. Shut system down, let pressure drop to a safe level.
C. Drain out fluid into suitable container and record the number of gallons removed. This is TOTAL SYSTEM FLUID CAPACITY.

**ESTIMATION METHOD**
A. Determine system pipe sizes and amount of linear footage for each size. Using Table I, calculate the volume of the steam piping.
B. Add this number to the gallon capacity of the boiler or equipment in the system to determine the TOTAL SYSTEM FLUID CAPACITY.

**TABLE I** (Note: 1 US Gallon = 3.785 Liters)

Note: The above chart differs from the cryo-tek – 100. Cryo-tek – 100 is based on actual numbers developed at NJIT. The cryo-tek – 100/AL chart above is based using the Dow tables at 60% PG.

* Pumpeable down to protection levels are estimated and are dependent on system and equipment. Attempting to circulate fluid below freeze point may overload and/or cause pump failure.

4. DETERMINE AMOUNT OF CRYO-TEK – 100/AL PRODUCT REQUIRED IN SYSTEM
Determine the amount of cryo-tek product needed in system by multiplying total system capacity in gallons by the concentration factor of cryo-tek – 100/AL product (first column in each chart above).

\[
\text{Total System Capacity (gal) } \times \text{ Concentration Factor of cryo-tek Product (%)} \times \text{Amount of cryo-tek Product to be used (gal)}
\]

5. CHARGING THE SYSTEM
System should be completely empty with burner and pump shut off. All internal valves, including zone valves, should be open. THE ENTIRE SYSTEM SHOULD BE OPEN TO PREVENT ANY AREA OF IT FROM BEING ISOLATED. First, add the computed amount of cryo-tek product, second add water if necessary. The system can be filled using one of the following two alternatives.

A. After providing for an air exit, pump solution into boiler through the boiler drain valve using a small pump.
B. Pour solution through a removed air vent at the HIGHEST point in the system.

6. PURGE THE AIR IN SYSTEM
Since air (which includes oxygen) trapped in a system not only results in inefficiencies in the operation of the system (wasted energy and excessive noise), it can also cause corrosion. To prevent this, the system, once filled, needs to be purged of all air.

7. TEST THE SYSTEM
Once installed and fully operational, use Hercules Refractometer with Refractometer Reading Adjustment Chart and pH test Meter or Cryo-tek Test Strips to test fluid to assure proper freeze and corrosion protection.

**Note:** An automotive coolant tester will not work with cryo-tek or other propylene glycol anti-freeze mixtures.

8. MAINTENANCE
Systems with cryo-tek – 100/AL installed should be tested annually for product concentration and inhibitor levels using Hercules Refractometer with Refractometer Reading Adjustment Chart and pH test Meter (or, less accurately Hercules Test Strips). If cryo-tek – 100/AL concentration levels are low, add cryo-tek – 100/AL using the following formula:

\[
\text{Number of gallons of cryo-tek to be added} = \text{TOTAL SYSTEM CAPACITY} \times \left(\frac{\% \text{ cryo-tek desired} - \% \text{ cryo-tek in system}}{\% \text{ cryo-tek used} - \% \text{ cryo-tek in system}}\right)
\]
8. MAINTENANCE (Con't)

Be sure to drain adequate fluid from system before adding the additional Cryo-tek -100/Al.

The proprietary inhibitor used in Hercules Cryo-tek -100/Al has an exceptionally long life expectancy. The pH of the system solution should always be between 7.0 and 8.5.

If the corrosion inhibitor tests low, add one 8 oz. container of Cryo-tek -100/Al Inhibitor in accordance with inhibitor label instructions for every 20 gallons of fluid capacity of the system. If the total system capacity is less than 20 gallons, add one 8 oz. container of Cryo-tek -100/Al Inhibitor. If after inhibitor addition and thorough system mixing, the corrosion inhibitor pH still tests low, add another 8 oz. container of Cryo-tek -100/Al Inhibitor for every 20 gallons of system capacity. If after this addition the inhibitor still tests low, the system should be drained, cleaned, and recharged with fresh Cryo-tek -100/Al.
